ATHLON Wireframe vs Live Application Analysis

3 November 2026 | Wireframe/PRD structural review + authenticated, read-only live inspection

Executive conclusion

The wireframe is the stronger product blueprint. The live app is the stronger working foundation where real data and operating flows already exist. Use the PRD as the staged product backlog, not as a mandate to reproduce all mock screens. The immediate work is to close trust, state-management and shared-business-core gaps before broadening surface area.

Evidence boundary

Observed live: public and authenticated player home, Organizer, Academy, Club and Venue dashboards. No record, payment, configuration or account change was made. Coach, Gym and Super Admin were unavailable to the supplied account. The local wireframe HTML was structurally reviewed from the supplied archive; browser policy prevented direct visual rendering of local file pages.

Headline comparison

Area	Wireframe/PRD	Live application	Assessment
Product framing	Complete consumer + five business suites + Admin and reusable core	Player marketplace and working organization workspaces	Wireframe provides stronger operating model
Venue	Full ERP with policies, workflow states, finance and channel intent	Calendar, bookings, recurring, facilities, pricing, blocks, reports and finances surfaced	Strongest live alignment; behavior still needs verification
Tournament	Full registration through ticketing/post-event	Create/manage/register/draw/schedule/scoring routes exist	Strong base; format and lifecycle matrix needed
Academy / Club	End-to-end lifecycle specified	Multiple workspace modules surfaced	Partial; commercial and guardian/membership detail incomplete
Shared core	CRM, invoices, comms, HR, audit, go-live, reports	Some settings/admin routes exist	Needs explicit shared data and lifecycle architecture

What to retain from the live app

Retain: existing public discovery, multi-workspace account model, venue booking foundation, tournament/event route structure, live score boards, and dynamic backend integration. These are valuable implementation assets that wireframes do not replace.

What to adopt from the wireframe

Adopt: shared Business Core, role-centered dashboards, explicit lifecycle/state models, organization-linking design, and phased scope. Replace dashboard feature inventories with a small action area plus a queue of work that needs attention.

Detailed product comparison

Area	Observed live / code evidence	Gap or risk	Priority
Consumer	Discovery cards, sport filters, venues, tournaments, community sessions and scores are live. Venue/academy/coach routes exist.	No verified sport-scoped product context, map search, family account, wallet/receipt/privacy centre, QR/cancel/reschedule evidence.	P0/P1
Venue	Venue workspace surfaces calendar, bookings, recurring, facilities, pricing, blocks, reports and finance.	Slot lock, parent-child resource conflict, policy engine, check-in/no-show, enquiry/quote, waitlist, invoices/settlements not proven.	P0/P1
Tournament	Organizer offers create/manage/registrations; source has draw, schedule and multi-sport scoring routes.	Supported-format matrix, waiver/partner/roster validation, scheduler constraints, score correction audit, tickets/certificates not proven.	P0/P1
Academy	Students, batches, admissions, coaches, attendance, progress, inventory and finance destinations are visible.	Guardian/medical/consent, trial funnel, fee lifecycle, canonical student record, parent access and report cards not proven.	P1
Club	Members, attendance, matches, ranking, inventory, analytics and finances visible.	Membership plan/dues/ID, team/squad, RSVP, polls/communication and linked-venue flows not proven.	P1
Business core	Multiple orgs/workspaces, roles/settings and admin routes exist.	CRM, explicit go-live gate, immutable audit, shared ledger/invoice, communications and organization linking need first-class treatment.	P0/P1
Admin/Gym	Admin routes exist in source. Gym mock exists in wireframe.	Admin inaccessible to this account; Gym not observed in live route inventory/workspace.	Separate review / future scope

P0 launch integrity backlog

Booking integrity

Server-authoritative slot locks, idempotency, exclusion protection, payment webhook reconciliation and visible cancellation/refund state.

Organization go-live

A checklist and verification gate for public listing: profile, geo, resource/programme, contact, payout, KYC and tax state.

Authorization and audit

Tenant scoped backend authorization, configurable role permissions and immutable financial/booking/score-correction audit trail.

Tournament integrity

Document formats that are genuinely supported and enforce correct registration, draw, schedule, scoring and advancement transitions.

Consumer onboarding

Verified sign-in, favourite sport/skill/location capture and profile completion that drive search and recommendations.

P1 commercial operations

Shared CRM/lead pipeline; invoices and GST receipts; academy admission/fees/guardian data; club memberships/dues/events; venue walk-in/check-in/recurring/enquiries; preference-aware notifications.

P2 scale and differentiation

Map/geo search, rating/leaderboards, tickets and gate scan, sponsors/certificates, parent/coach companion apps, channel integrations, HR/payroll/maintenance/cleaning and Gym.

Recommended delivery sequence

Release	Scope	Release gate
R1 - Core trust	Booking lock/reconciliation, go-live, RBAC/audit, onboarding, venue core	Concurrency proves one booking per slot; sensitive state changes audited.
R2 - Commerce & events	Ledger/invoices, complete registration-to-result flow, counter/check-in, CRM	A real tournament completes with reconcilable booking/payment/score records.
R3 - Academy & club	Admission/fees/attendance, membership/dues/RSVP, guardian basics	Student and member lifecycles work without manual side channels.
R4 - Scale	Tickets, maps, ratings, integrations, advanced reports	Support, security and metrics support growth.

Implementation guidance

Do not recreate all wireframe screens. Build a single reusable set of record shells, state components and shared services first. Every dashboard should foreground pending work, not a carousel of modules. Every core entity - Booking, Invoice, Participant/Team, Student, Member, Organization and Match - needs one canonical detail page and an explicit state history.

Next validation steps

Run full disposable-data E2E tests for booking/payment/cancellation, tournament registration/draw/scoring, academy admission/fees, and club membership. Perform tenant isolation and role tests. Review Admin with an authorized test account. Confirm MVP sports/city, payment/settlement policy, verification policy and whether Gym is in launch scope.
